## COMP3411/9414 Artificial Intelligence Term 1, 2019

## **Project 3: Nine-Board Tic-Tac-Toe**

Marks: 16% of final assessment

Due: Wednesday 1 May, 11:59 pm

This game is played on a 3 x 3 array of 3 x 3 Tic-Tac-Toe boards. The first move is made by placing an x in a randomly chosen cell of a randomly chosen board. After that, the two players take turns placing an o or x alternately into an empty cell of the board corresponding to the cell of the previous move. (For example, if the previous move was into the upper right corner of a board, the next move must be made into the upper right

Introduction

board.)

The game is won by getting three-in-a row either horiz

The game is won by getting three-in-a row either horizontally, vertically or diagonally in one of the nine boards. If a player is unable to make their move (because the relevant board is already full) the game ends in a draw.

Getting Started

In this project you will be writing an agent to play the game of Nine-Board Tic-Tac-Toe.

Copy the archive src.zip into your own filespace and unzip it. Then type

cd src
make all
./servt -x -o

./servt -p 12345 -x

This tells the server to use port 12345 for communication, and that the moves for x will be chosen by you, the human, typing at the 12345 is busy, choose another 5-digit number.)

You should then type this into the second window (using the same port number):

./randt -p 12345

The program randt simply chooses each move randomly among the available legal moves.

The Prolog program random.pl behaves in exactly the same way. You can play against it by typing this into the second window:

(the parameters for these commands are explained in the comments of agent.pl)

**Player O** 

init  $\rightarrow$ 

← 7

 $\leftarrow 6$ 

 $start(o) \rightarrow$ 

Server

second move $(6,1) \rightarrow$ 

next move(9)  $\rightarrow$ 

last move(5)  $\rightarrow$ 

 $loss(triple) \rightarrow$ 

end  $\rightarrow$ 

You are free to write your player in any language you wish.

2. If you write in Java, your program will be invoked by

3. If you write in Python, your program will be invoked by

4. If you write in C or C++, your program will be invoked by:

periodically run a script to load these values into SMS.

and student number of the two group members.

The submission deadline is Wednesday 1 May, 11:59 pm.

Forum, you can email it to blair@cse.unsw.edu.au

15% penalty will be applied to the (maximum) mark for every 24 hours late after the deadline.

correctly will receive more marks than one attempting to do the entire job but with many errors.

DO NOT COPY FROM OTHERS; DO NOT ALLOW ANYONE TO SEE YOUR CODE

• 10 marks for performance against a number of pre-defined opponents.

than understanding the logic behind the provided file. It's also plagiarism.

6 marks for Algorithms, Style, Comments and answer to the Question

Additional information may be found in the <u>FAQ</u> and will be considered as part of the specification for the project.

COMP3411 students should submit by typing

COMP9414 students should submit by typing

If you wish to write in some other language, let me know.

prolog (port) < agent.wrap</pre>

java Agent -p (port)

./agent.py -p (port)

#!/usr/bin/python

./agent -p (port)

made along the way.

that's ok too).

using the following command:

1. If you write in Prolog, your program will be invoked like this:

alphabeta.pl (which implements alpha-beta search for regular Tic-Tac-Toe).

You should submit your .java files (no .class files). The main file must be called Agent.java

You should submit your .pl files (including agent.pl). Feel free to use agent.pl (identical to randt.pl) as a starting point, as well as

You should submit your .py files (including agent.py). The first line of your code must specify which version of Prolog you are using, e.g.

You should submit your source files (no object files) as well as a Makefile which, when invoked with the command "make", will produce an

Briefly describe how your program works, including any algorithms and data structures employed, and explain any design decisions you

This assignment may be done individually, or in groups of two students. Groups are determined by an SMS field called hw3group. Every student has

1. If you plan to complete the assignment individually, you don't need to do anything (but, if you do create a group with only you as a member,

2. If both members of the group are enrolled in COMP3411, you should go to this <u>WebCMS page</u> and click on "Groups" in the left hand column, then click "Create". Click on the menu for "Group Type" and select "hw3". After creating a group, click "Edit", search for the other member,

4. If one group member is enrolled in COMP3411 and the other in COMP9414, please send email to blair@cse.unsw.edu.au stating the name

You can submit as many times as you like - later submissions will overwrite earlier ones. You can check that your submission has been received by

Questions relating to the project can be posted to the Forums on the course Web site. If you have a question that has not already been answered on the

You should always adhere to good coding practices and style. In general, a program that attempts a substantial part of the job but does that part

DO NOT COPY CODE FROM THE INTERNET. This approach has a very specific structure. Copying/adapting code is likely to take much longer

Your program must be entirely your own work. Plagiarism detection software will be used to compare all submissions pairwise (including

submissions for any similar projects from previous years) and serious penalties will be applied, particularly in the case of repeat offences.

Please refer to the <u>UNSW Policy on Academic Honesty and Plagiarism</u> if you require further clarification on this matter.

and click "Add". WebCMS assigns a unique group ID to each group, in the form of "g" followed by six digits (e.g. g012345). We will

3. If both members of the group are enrolled in COMP9414, go instead to this WebCMS page and follow the same instructions as above.

executable called agent. Feel free to use the supplied files as a starting point (especially agent.c which is identical to randt.c)

At the top of your code, in a block of comments, you must provide a brief answer (one or two paragraphs) to this Question:

initially been assigned a unique hw3group which is "h" followed by their studentID number, e.g. h1234567.

 $\leftarrow$  third move(6,1,7)

 $\leftarrow$  next move(6)

 $\leftarrow$  win(triple)

 $\leftarrow$  end

Communication between the server and the player(s) is illustrated in this brief example:

The Prolog program random.pl behaves in exactly the same way. You can play against it by typing this into the second window:

prolog 12345 < agent.wrap

You can play against a slightly more sophisticated player by typing this into the second window:

./lookt -p 12345

(If you are using a Mac, type ./lookt.mac instead of ./lookt)

To play two computer programs against each other, you may need to open three windows. For example, to play agent against lookt using port 54321, type as follows:

(If you are using a Mac, type ./lookt.mac instead of ./lookt)

To play two computer programs against each other, you may need to open three very type as follows:

window 1: ./servt -p 54321

window 2: ./agent -p 54321

window 3: ./lookt -p 54321

(Whichever program connects first will play x; the other program will play o.)

Alternatively, you can launch all three programs from a single window by typing

window 3: ./lookt -p 54

(Whichever program connormal Alternatively, you can laund ./servt -p 54321 & ./agent -p 54321 & ./lookt -p 54321

or, using a shell script: ./playc.sh lookt 54321

To play the prolog program agent.pl against lookt using port 23232, you can type

./servt -p 23232 & prolog 23232 < agent.wrap & ./lookt -p 23232

or, using a shell script:
./playpl.sh lookt 23232

(If you are using a Mac, edit playpl.sh and replace "prolog" with "swipl")

The strength of lookt can be adjusted by specifying a maximum search depth (default value is 9; reasonable range is 1 to 18), e.g.
./lookt -p 12345 -d 6

or
./playc.sh "lookt -d 16" 54321

Writing a Player

Your task is to write a program to play the game of nine-board tic-tac-toe as well as you can.

Your program will receive commands from the server (init, start(), second\_move(), third\_move(), last\_move(), win(), loss(), draw(), end()) and must send back a single digit specifying the chosen move.

Player X

 $\leftarrow$  init

 $9 \rightarrow$ 

 $5 \rightarrow$ 

**Language Options**
